

OrthoATI™

innovative treatment for
chronic tendon injuries

Summary of
clinical evidence

Long term data in tennis elbow (lateral epicondylitis)¹.

Lateral epicondylitis (LE) is the most commonly diagnosed condition of the elbow. It occurs mostly in patients whose activities require strong gripping or repetitive wrist movements. Although LE generally resolves within 6 months, approximately 10% of patients continue to experience persistent pain and loss of function after 6 months of conservative treatment.² This results in significant disability, health care use, lost productivity and financial cost.

Long term data for gluteal tendinopathy¹.

Gluteal tendinopathy is a common cause of lateral hip pain and is frequently described as a constant ache on the side of the hip. Pain is often at its worst in the morning, leaving patients unable to perform their normal daily activities. Recurring symptoms are common after standard conservative treatments.

Workers compensation data¹.

Tennis elbow (lateral epicondylitis) is painful, difficult to treat and has a long period of recovery. It is a common work-related injury that may require extended periods of sick leave or restricted duties.

OrthoATI™ was used to treat a group of patients (n=24) with long-term symptoms of tennis elbow (average of 2 years) and who failed to respond to other treatments.

Patients who needed time off work due to their injury missed an average of 141 days. When they did return to work, patients had restricted duties or reduced hours.

"Before having the treatment I underwent three lots of surgery and had pretty much accepted I would never be 100% again. I have experienced a 100% recovery, I am pain free, able to exercise and run without issue. I have been able to continue my job as a tactical flight officer."

Annual quality survey data¹.

The annual quality survey (AQS) has been administered four times between 2016 and 2020 with one hundred and sixty patients responding. The AQS evaluates patient satisfaction with their treatment.

Results across all treatment areas:

1. Orthocell Annual Quality Survey 2016 - 2020

OrthoATI™ for the treatment of chronic tendon injuries

"Prior to OrthoATI™ I had corticosteroid injections, blood/PRP injections and three separate surgeries and nothing worked. I could not walk 2kms without severe swelling and pain. I was in constant pain every night and for three years I woke at 3am in severe pain. Four weeks after the injection I walked 12km's, slept soundly and exercised without a limp. I can also run again".
